ABSTRACT

In this paper we have proposed a class of transformed efficient estimators of finite population mean by modifying Mohanty and Sahoo (1995) transformation. The approximate bias and MSE of the proposed class of estimators have been found. Conditions under which the proposed class of transformed estimators performs good, have been obtained. Examples are given based on real life data to illustrate the results.

KEYWORDS

Auxiliary Information, Transformation, Efficiency, Mean Square Error.

1. INTRODUCTION

In this paper we have proposed an efficient estimator for estimating the mean of the finite population under simple random sampling without replacement sampling and stratified random sampling schemes. Motivated by Subramani and Kunarpendyani (2012), Bedi (1996), Mohanty and Sahoo (1995), Shabbir and Gupta (2011), we have made use of auxiliary information by introducing some transformation.

The Classical estimator of the mean of the finite population \( \bar{Y} \) is \( \bar{y} \). Variance of \( \bar{y} \) is

\[
V(\bar{y}) = \lambda C_y^2, \text{ where } \lambda = \frac{1}{n} - \frac{1}{N}
\]

(1.0)

Cochran (1940) introduced the traditional ratio type estimator of population mean, as

\[
\bar{y}_{cr} = \left( \frac{\bar{y}}{\bar{x}} \right) \bar{X}
\]

(1.1)

with the following bias and MSE

\[
B(\bar{y}_{cr}) \approx \lambda \bar{Y} \left( C_x^2 - C_{yx} \right)
\]

(1.2)

and

\[
MSE(\bar{y}_{cr}) \approx \lambda \bar{Y}^2 \left( C_y^2 + C_x^2 - 2\rho C_y C_x \right).
\]

(1.3)
where \( C_y^2 = \frac{S_y^2}{\bar{Y}^2} \) is the coefficient of variation of variable \( Y \), \( C_x^2 = \frac{S_x^2}{\bar{X}^2} \) is the coefficient of variation of \( X \), \( C_{yx} = \frac{S_{yx}}{\bar{Y} \bar{X}} \) is the coefficient of covariance of \( X \) and \( Y \) and 
\[
\rho = \frac{C_{yx}}{C_y C_x}
\]
is the coefficient of correlation between \( Y \) and \( X \).

The classical regression estimator given by Hansen and Harwitz (1943) is
\[
\bar{y}_{lr} = \bar{y} + b_{yx} (\bar{X} - \bar{x})
\]
with the following mean square error
\[
MSE(\bar{y}_{lr}) \approx \bar{Y}^2 \lambda C_y^2 \left( 1 - \rho^2 \right)
\]
(1.5)

This is a well-established fact that regression estimator is efficient when the linear relationship passes in the neighborhood of origin.

An exponential ratio type estimator due to Bhal and Tuteja (1991) is given by
\[
\bar{y}_{BT} = \bar{y} \exp \left( \frac{\bar{X} - \bar{x}}{\bar{X} + \bar{x}} \right)
\]
(1.6)

The bias and MSE due to \( \bar{y}_{BT} \) is given by
\[
B(\bar{y}_{BT}) = \lambda \bar{Y} \left( \frac{3C_x^2}{8} - \frac{C_{yx}}{2} \right)
\]
(1.7)

and
\[
MSE(\bar{y}_{BT}) = \lambda \bar{Y}^2 \left( C_y^2 + \frac{C_x^2}{4} - C_{yx} \right)
\]
(1.8)

Mohanty and Sahoo (1995), introduces the following transformation in ratio estimator of population mean
\[
t_1 = \frac{\bar{y}}{\bar{z}} Z
\]
and
\[
t_2 = \frac{\bar{y}}{\bar{u}} U
\]
where \( z_i = \frac{x_i + x_m}{x_M + x_m} \) and \( u_i = \frac{x_i + x_M}{x_M + x_m} \).

\( x_m \) is the minimum and \( x_M \) is the maximum value of auxiliary variable with in the data.
The biases and MSEs of \( t_1 \) and \( t_2 \) are given by
\[
B(t_1) = \lambda \bar{Y} \left( S_z^2 - S_{yz} \right),
\]
(1.9)
\[
B(t_2) = \lambda \bar{Y} \left( S_u^2 - S_{yu} \right),
\]
(1.10)
\[
MSE(t_1) = \lambda \bar{Y}^2 \left( C_y^2 + C_z^2 - 2C_{yz} \right),
\]
(1.11)
\[
MSE(t_2) = \lambda \bar{Y}^2 \left( C_y^2 + C_u^2 - 2C_{yu} \right),
\]
(1.12)
where \( C_z^2 = \frac{c_z^2}{c_1^2}, C_u^2 = \frac{c_u^2}{c_2^2}, C_{yz} = \frac{c_{yx}}{c_1} \) and \( c_1 = 1 + \frac{x_m}{\bar{X}}, c_2 = 1 + \frac{x_M}{\bar{X}} \).

Shabbir and Gupta (2011) proposed the following transformed exponential ratio type of estimator
\[
\bar{y}_{SG} = \left\{ \tau_1 \bar{y} + \tau_2 \left( \bar{X} - \bar{x} \right) \right\} \left\{ \exp \left( \frac{\bar{A} - \bar{a}}{\bar{A} + \bar{a}} \right) \right\},
\]
(1.13)
where \( \bar{a} = \bar{x} + N\bar{X} \) and \( \bar{A} = \bar{X} + N\bar{X} \)

With the following MSE
\[
MSE(\bar{y}_{SG}) = \bar{Y}^2 \left[ 1 - \lambda \frac{C_x^2}{4(N+1)^2} \left( 1 - \frac{1}{8(N+1)^2} \right) \frac{1}{1 + \lambda C_y^2 \left( 1 - \rho^2 \right)} \right]
\]
(1.14)
where the optimum value of \( \tau_1 \) and \( \tau_2 \) is given by
\[
\tau_1 = \frac{1 - \lambda \frac{C_x^2}{8(N+1)^2}}{1 + \lambda C_x^2 \left( 1 - \rho^2 \right)} \quad \text{and} \quad \tau_2 = \frac{\bar{Y}}{\bar{X}} \left\{ \frac{1}{2(N+1)} - \tau_1 \left( \frac{1}{N+1} - \rho \frac{C_y}{C_x} \right) \right\}.
\]

2. **SUGGESTED TRANSFORMATION**

Mohanty and Sahoo (1995) suggested the following transformation of the auxiliary variable
\( v_i = \frac{x_i + \eta}{\eta + \pi} \) and \( v_i = \frac{x_i + \pi}{\eta + \pi} \) or \( \bar{v} = \frac{\overline{x} + \eta}{\eta + \pi} \) and \( \bar{v} = \frac{\overline{x} + \pi}{\eta + \pi} \) (2.1)

where \( \eta = x_m \) and \( \pi = x_M \).

Further we can write \( E(\bar{v}) = \overline{\bar{x} + \eta} \) and \( E(\bar{v}) = \overline{\overline{\bar{U}}} = \frac{\overline{x} + \pi}{\eta + \pi} \).

Further we write \( E\left( \frac{\bar{v} - \bar{V}}{V} \right) = \left( \frac{1-f}{n} \right) \frac{C^2}{c_1^2} \) and \( E\left( \frac{\bar{v} - \overline{\bar{U}}} {\overline{\bar{U}}} \right) = \left( \frac{1-f}{n} \right) \frac{C^2}{c_2^2} \),

where \( c_1 = 1 + \frac{\eta}{X} \) and \( c_2 = 1 + \frac{\lambda}{X} \). (3.2)

Obviously, for the above transformation one has to find out two features of auxiliary variable, such as \( \eta \) and \( \lambda \) for estimator of finite population mean. One of the disadvantage of the above transformation is that, only one constant are taking part in the reduction of MSE while the other has no contribution at all. In order to remove the extra feature from estimator and to incorporate only those feature which are taking contribution in the reduction of MSE, we precede as following.

We write (2.2) as

\[ c = 1 + \frac{\eta}{X} \] or \( \eta = \bar{X}(c-1) \)

where \( \eta \) is constant or some function of auxiliary information.

The proposed transformation is

\[ x^*_i = x_i + \eta, \] or \( \bar{x}^* = \bar{x} + \eta \) \( \bar{x}^* = \bar{x} + \bar{X}(c-1), \) and \( E\left( \bar{x}^* \right) = \bar{X}, \) where \( \bar{x}^* = \bar{c}\bar{X}. \)

3. PROPOSED ESTIMATOR IN SIMPLE RANDOM SAMPLING

Following Bhal and Tuteja (1991) and Shabbir and Gupta (2011), we suggest the following class of estimators

\[ \bar{y}_{prk} = \left\{\omega_1\bar{Y} + \omega_2 \left( \overline{\bar{X} - \bar{x}} \right) \right \} \exp \left[ \frac{\bar{x}^* - \bar{X}^*}{\bar{x}^* - \bar{X}^*} \right], k = 1, 2, 3, 4 \] (3.1)

where \( \bar{X}^* = \bar{X}c_k \) and \( \bar{x}^* = \bar{x} + \bar{X}(c_k -1), \) or \( E\left( \bar{x}^* \right) = \bar{X}^*. \)

Further

\[ c_1 = C_x, c_2 = \rho + 1, c_3 = \frac{\rho+1}{2}, c_4 = \frac{\rho+1}{3}. \] \( k = 1, 2, 3, 4. \)
where \( \omega_1 \) and \( \omega_2 \) are suitable constant to be determined so that MSE is minimum, where “\( c_k \)” is to be chosen, so that the transformed data results high gain in efficiency. We will use the following terms to find the Bias and MSE due to our proposed estimator

\[
e_0 = \left( \frac{\bar{Y} - \bar{y}}{\bar{Y}} \right), \quad e_1 = \left( \frac{\bar{X} - \bar{x}}{\bar{X}} \right) \quad \text{or} \quad e_1 = \frac{x^*_c - \bar{x}^*}{\bar{X}^*}
\]

such that

\[
E(e_1) = E(e_0) = 0, \quad E(e_0^2) = \lambda C^2_y, \quad E(e_1^2) = \lambda C^2_x
\]

and

\[
E(e_0 e_1) = \lambda C_{yx} \quad \text{or} \quad E(e_0 e_1) = \lambda \rho C_y C_x.
\]

Then we can write (3.1) as follows

\[
\bar{y}_{pri} = \left\{ \omega_1 \bar{Y} (1 + e_0) - \bar{X} \omega_2 e_1 \right\} \exp \left\{ -\frac{e_1}{2c_k} \left( 1 + \frac{e_1}{2c_k} \right)^{-1} \right\}
\]

or

\[
\bar{y}_{pri} = \left\{ \omega_1 \bar{Y} (1 + e_0) - \bar{X} \omega_2 e_1 \right\} \left\{ 1 - \frac{e_1}{2c_k} + \frac{3e_1^2}{8c_k^2} + \ldots \right\} \quad (3.2)
\]

Terms with power higher than two can be ignored, we have

\[
\bar{y}_{pri} - \bar{Y} \approx \bar{Y} \left\{ (\omega_1 - 1) + \omega_1 \left( e_0 - \frac{e_1}{2c_k} - \frac{e_0 e_1}{2c_k} + \frac{3e_1^2}{8c_k^2} \right) \right\} - \omega_2 \bar{X} \left\{ e_1 - \frac{e_1^2}{2c_k^2} \right\} \quad (3.3)
\]

We can define the Bias due to our proposed estimator by

\[
Bias(\bar{y}_{pri}) \equiv E(\bar{y}_{pri} - \bar{Y})
\]

or

\[
Bias(\bar{y}_{pri}) \equiv \bar{Y} \left\{ (\omega_1 - 1) + \omega_1 \lambda \left( \frac{3C^2_y}{8c_k^2} - \frac{C_{yx}}{2c_k} \right) \right\} + \omega_2 \bar{X} \lambda \left( \frac{C^2_x}{2t_i^2} \right) \quad (3.4)
\]

For MSE, Squaring and taking expectation of equation (3.3), we have

\[
E \left( \bar{y}_{pri} - \bar{Y} \right)^2 \approx \left\{ \bar{Y} (\omega_1 - 1) + \omega_1 \bar{Y} \left( e_0 - \frac{e_1}{2c_k} - \frac{e_0 e_1}{2c_k} + \frac{3e_1^2}{8c_k^2} \right) \right\} - \omega_2 \bar{X} \left\{ e_1 - \frac{e_1^2}{2c_k^2} \right\} \quad (3.5)
\]

Since

\[
MSE(\bar{y}_{pri}) \equiv E \left( \bar{y}_{pri} - \bar{Y} \right)^2
\]
\[
MSE(\overline{y}_{prk}) = \overline{Y}^2 \left[ (\omega_1 - 1)^2 + \omega_1^2 \left( \frac{C^2_x}{c_k^2} - \frac{2C_{yx}}{c_k} \right) - 2\lambda \omega_1 \left( \frac{3C^2_x}{8c_k^2} - \frac{C_{yx}}{2c_k} \right) \right] \\
+ \omega_2^2 \overline{X}^2 \lambda C^2_x - \omega_2 \lambda \overline{Y}X \frac{C^2_x}{c_k} + 2\omega_1 \omega_2 \lambda \overline{Y}X \left( \frac{C^2_x}{c_k} - C_{yx} \right)
\]

(3.6)

The optimum values of \( \omega_1 \) & \( \omega_2 \) can be obtained by differentiating MSE of \( \overline{y}_{prk} \) with respect to the \( \omega_1 \) & \( \omega_2 \) by

Differentiating (3.6) w.r.to \( \omega_1 \) and equating to zero \( \frac{\partial MSE(\overline{y}_{prk})}{\partial \omega_1} = 0 \) we get

\[
\overline{Y}^2 \left[ 2(\omega_1 - 1) + 2\omega_1 \lambda \left( C^2_y + \frac{C^2_x}{c_k^2} - \frac{2C_{yx}}{c_k} \right) - 2\lambda \left( \frac{3C^2_x}{8c_k^2} - \frac{3C_{yx}}{2c_k} \right) \right] \\
+ 2\omega_2 \lambda \overline{Y}X \left( \frac{3C^2_x}{c_k} - C_{yx} \right) = 0
\]

(3.7)

Differentiating (3.6) w.r.to \( \omega_2 \) and equating to zero, we get \( \frac{\partial MSE(\overline{y}_{prk})}{\partial \omega_2} = 0 \) we get

\[
2\omega_2 \overline{X}^2 \lambda C^2_x - \lambda \overline{Y}X \frac{C^2_x}{c_k} + 2\omega_1 \lambda \overline{Y}X \left( \frac{C^2_x}{c_k} - C_{yx} \right) = 0
\]

(3.8)

Solving equation (3.7) & (3.8) simultaneously to get the optimum values of \( \omega_1 \) & \( \omega_2 \). After simplification we have

\[
\omega_{1opt} = \frac{1 - \frac{\lambda C^2_y}{8c_k^2}}{1 + \lambda C^2_y (1 - \rho^2)} \quad \text{and} \quad \omega_{2opt} = \frac{\overline{Y}}{X} \left[ \frac{1}{2c_k} - \omega_{1opt} \left\{ \frac{3}{c_k} - \rho \frac{C_y}{C_x} \right\} \right]
\]

Substituting these values in (3.6), we get

\[
MSE(\overline{y}_{prk}) = \overline{Y}^2 \left[ \left\{ 1 - \frac{\lambda C^2_x}{4c_k^2} \right\} - \left( \frac{1 - \lambda \frac{C^2_x}{8c_k^2}}{1 + \lambda C^2_y (1 - \rho^2)} \right)^2 \right]
\]

(3.9)
4. THEORETICAL COMPARISON OF THE PROPOSED ESTIMATOR IN SRSWOR

In this section we will compare the MSE of our proposed estimator with the existing estimator discussed here above.

1) \( \text{MSE}(\bar{y}_{prk}) < \text{MSE}(\bar{y}) \)

If

\[
\left\{1 - \lambda \frac{C_x^2}{4c_k^2}\right\} - \left(\frac{1 - \lambda \frac{C_x^2}{8c_k^2}}{1 + \lambda C_y^2 \left(1 - \rho^2\right)}\right)^2 - \lambda C_y^2 < 0
\]

this is hold true for all choices of \( c_k \).

2) \( \text{MSE}(\bar{y}_{prk}) < \text{MSE}(\bar{y}_{cr}) \)

If

\[
\frac{\left(1 - \lambda \frac{C_x^2}{8c_k^2}\right)^2}{\left\{1 + \lambda C_y^2 \left(1 - \rho^2\right)\right\}} + \lambda \left(C_y^2 - C_x^2 - 2\rho C_y C_x\right) - \left\{1 - \lambda \frac{C_x^2}{4c_k^2}\right\} > 0
\]

3) \( \text{MSE}(\bar{y}_{prk}) < \text{MSE}(\bar{y}_{lr}) \)

If

\[
\frac{\left(1 - \lambda \frac{C_x^2}{8c_k^2}\right)^2}{\left\{1 + \lambda C_y^2 \left(1 - \rho^2\right)\right\}} + \lambda C_y^2 \left(1 - \rho^2\right) - \left\{1 - \lambda \frac{C_x^2}{4c_k^2}\right\} > 0
\]

4) \( \text{MSE}(\bar{y}_{prk}) < \text{MSE}(\bar{y}_{BT}) \)

If

\[
\left\{1 - \lambda \frac{C_x^2}{4c_k^2}\right\} - \left[\frac{\left(1 - \lambda \frac{C_x^2}{8c_k^2}\right)^2}{\left\{1 + \lambda C_y^2 \left(1 - \rho^2\right)\right\}} + \lambda \left(C_y^2 + \frac{C_x^2}{4} - C_{yx}\right)\right] > 0
\]

5) \( \text{MSE}(\bar{y}_{prk}) < \text{MSE}(\bar{y}_{SG}) \)

If
\[
\left\{1 - \frac{C_x^2}{4c_k^2}\right\} - \left(1 - \lambda \frac{C_x^2}{8c_k^2}\right) - \left\{1 - \lambda \frac{C_x^2}{4(N+1)^2}\right\} + \left\{1 - \frac{C_x^2}{8(N+1)^2}\right\} < 0
\]

\[
\left(1 - \frac{c_k^2}{(N+1)^2}\right) - \frac{C_x^2}{4} \left(\frac{1}{N+1} - \frac{1}{c_k^2}\right) + \lambda \frac{C_x^2}{8} \left(\frac{1}{N+1} - \frac{1}{c_k^2}\right) > 0
\]

Conditions 1 to 5 will always hold true for all types of real data especially for some choices of “\(c_k\)”.

5. NUMERICAL COMPARISON OF THE PROPOSED ESTIMATOR FOR SRS

In this section we will make an assessment of the efficiency of our proposed estimator under SRS using data sets from real life examples. It should be noted that if we put \(c = N+1\) or \(\bar{X}^* = \bar{X} + N\bar{X}\) then our proposed estimator will reduces to Shabbir and Gupta (2011) estimator.

CONCLUSION

From the above analysis it is clear that our proposed estimators for various value of transformer \( c_1 = C_x, c_2 = \rho + 1, c_3 = \frac{\rho + 1}{2}, c_4 = \frac{\rho + 1}{3} \) are superior to all other estimators considered in this paper. Hence the transformation results considerable reduction in MSE, as obvious from the above table and high gain in efficiency. Similar strategy can be used for further optimization of existing estimators or for the development of new estimators.
